Embedded Software Architecture MasterClass

Embedded software architecture is the foundation of reliable, maintainable, and scalable embedded systems. Yet, many developers find themselves trapped in monolithic designs, tangled dependencies, and technical debt that slow innovation and make systems hard to evolve.

This masterclass provides a practical, hands-on deep dive into embedded software architecture, equipping engineers with the skills, patterns, and decision-making frameworks needed to build modern, modular, and resilient embedded systems.

Through real-world case studies and guided exercises, you'll learn how to apply industry-proven architectural practices such as Architecture Decision Records (ADRs), the C4 Model, and data-centric design, enabling you to structure embedded software for flexibility, testability, and long-term maintainability.

By the end of this course, you'll have the confidence to design embedded architectures that scale—whether for IoT, industrial automation, robotics, or safety-critical applications.

We'll explore essential topics such as:

- Architectural design principles and characteristics
- Design patterns for bare-metal and RTOS-based systems
- Architecture diagrams like context, container, component, and class
- Data-centric versus control-centric architectures
- Architectural patterns like unitary, client/server, monolithic, microkernels, service-based, event-driven, orchestration, and microservices.

The workshop will be available on demand starting April 7th, 2025, with live Q&A sessions on the following dates:

- April 9th, 2025 @ 11 EDT
- April 16th, 2025 @ 11 EDT
- April 30th, 2025 @ 11 EDT

This workshop is included in the Embedded Software Academy by Beningo subscription.
